

## Areas of Interest (AOIs)

NICO is interested in providing support for research on novel applications of the use of NICO technologies in clinical practice which lead to significant changes or improvements in clinical, economics, or operational outcomes.

Below is a high-level overview of various Areas of Interest (AOIs), in no specific order, for the Investigator Initiated Study (IIS) program. These concepts are provided to help guide project development and do not encompass the many topics which may be represented through an IIS submission. Concepts designed with one or more of these AOIs in mind, will receive the highest consideration. However, concepts outside of the AOIs representing 'out of the box' thinking or ultimately of great interest, may also be evaluated.

All studies from laboratory science, animal studies, and clinical features have equal opportunity for acceptance.
